

OPPORTUNITY INTELLIGENCE & EVIDENCE-ASSISTED PROPOSAL PLATFORM

CONFIDENTIAL CLIENT ENGAGEMENT / PORTFOLIO CASE STUDY

I led the architecture and AI-assisted delivery of a two-tool workflow that connects public opportunity discovery with evidence-assisted proposal preparation—while keeping data contracts, failure states and human review explicit.

DELIVERED WORKFLOW

01 Discover Multi-source opportunity collection	02 Qualify Bilingual matching and transparent reasons	03 Review ToR extraction and requirement checks	04 Retrieve Searchable capability evidence	05 Draft Human-reviewed DOCX output
---	---	---	--	---

THE PROBLEM

Proposal teams navigate fragmented portals, interpret requirements and locate credible evidence of past capability. Every handoff can lose context or turn a technical failure into a misleading business signal.

WHAT I DELIVERED

- **Tool 1:** portal adapters, English/Spanish matching, full-text enrichment, discovery timestamps and matched-keyword tracking through a validated Sheet contract.
- **Tool 2:** read-only search, filters, sorting and pagination; ToR upload and review; evidence retrieval; editable draft generation and DOCX export.

ENGINEERING DECISIONS

- **Header-name-driven integration.** Reordered columns cannot silently corrupt shared records.
- **Honest failure semantics.** A source outage is not reported as a successful search with zero results.
- **Evidence-preserving updates.** Supported failures retain last-known-good passages and report incomplete recovery.
- **Transparent counts.** Source files, indexed documents and search chunks remain distinct.

MY ROLE

Architecture · Product scoping · AI-assisted implementation workflow · Code review · Testing · Integration · Delivery control

TECHNOLOGY

Python
Streamlit
Google Sheets
Chroma vector index
LLM-assisted extraction and drafting
DOCX export

DELIVERY METHOD

Explicit contracts, bounded implementation tasks, independent review, adversarial tests and controlled integration.

CURRENT BOUNDARY

Generated text, extracted requirements and source references require human verification. Deterministic quote-to-source verification is planned next-stage work.

RESULT

A connected discovery-to-document workflow with reviewable handoffs, visible partial failures and explicit human accountability.
